Digital Night Vision Optics

OVERVIEW

The Personal Digital Night Surveillance Device System (powered by AD2V) makes operations safer and more effective:

- The only digital night vision goggle that fully interfaces with combat and law enforcement helmets and can be worn underneath a visor.
- The goggle is designed specifically for forced entry operations and combat situations
- The goggle comes with build-in, additional adjustable infra-red illumination for passive and active operation.
- The goggles can be used in daylight without harming the system and even without realizing the difference in picture quality as compared to night operation
- Live-firing or a flash bang will not create a blinding or blackout condition
- The ergonomic design and the low weight allows comfortable use in motion, even during extended operations
- The device does not allow screen-light to be seen from the exterior
- Can be worn with or without helmet just like a tactical goggle
- Digital black and white screens allow better target recognition and faster decision time
- Improved spatial awareness and natural balance for the user
- Instant dark to light or light to dark conditions are compensated for by the device and the user is unaffected
